

How does a city address food production?

60+ projects and products from Canada and abroad – both real and proposed – are represented through images, text, models and videos.

Carrot City

Designing for Urban Agriculture

An exhibit that explores the issue at four scales – the city, the community, home and work, and products that enable growing.

Artists, architects, landscape architects and other designers are changing the nature of cities to provide opportunities for food production on rooftops, within unused spaces, at home and work, and in the public realm. This exhibition will explore issues related to designing for urban agriculture, including:

What is the place of food in the city?

How are “wasted” spaces being transformed by food projects?

What are the implications of such ideas on materials, technologies and structures?
